French Engineering Grandes Ecoles France's Higher Education

20. ABSTRACT (Continue on reverse side if necessary and identify by block number)

A review of the characteristics of a unique system of higher education found in France: The "Grandes Ecoles." The report looks in some detail at the engineering schools in France and provides an overall view of French engineering.

#### FRANCE'S GRANDES ECOLES

#### I. Introduction

In the last ten years the French university system has undergone reforms and radical changes which, at times, made the headlines in the press; yet, France's "Other" system of higher education, the "Grandes Ecoles," remained almost unaffected. Why is it that, in the same country and for two systems dealing with higher education, the reaction has been so different? To answer that question one must first understand what is a "Grande Ecole." I will try to present the reader with this concept; the task is difficult because this system, which is roughly 200 years old, has evolved like a living thing and spread to embrace many facets. I will also touch on how engineers are trained and the position they occupy after graduation.

Recently, while visiting a US laboratory, a graduate from one of these Grandes Ecoles was asked about his education. He replied that he studied in a "High School"! Although the latter is a literal translation from French, a "Grande Ecole" is far from being a "high school" as we know it in the States. It is an establishment of higher education whose purpose is to train highly qualified specialists in such fields as industry, business, engineering, the civil service or the military sciences. These Ecoles are a feature peculiar to the French educational system. Historically the oldest Ecoles were founded a few years after the French Revolution; many were founded by Napoleon who saw the need for highly qualified teachers and military and civil engineers. Note that the engineering profession started as a service to the military. A great many Ecoles were also started at the turn of this century when the Industrial Revolution initiated a proliferation of various technologies (see Appendix). At present, there are 144 Grandes Ecoles, about half of which are located in or around Paris. There are about 10,000 incoming first-year students in the Ecoles which represent some 10% of the entire firstyear enrollment in the French university system. The total number of students in these Ecoles is about 40,000.

It is hard to compare these Ecoles with a similar education in the US. If, for the time being, we limit our attention to the engineering schools, one could compare the Grande Ecole training to, perhaps, the Master's level at institutes of technology such as MIT or Cal Tech,

although the teaching drills and the entrance requirements of the Ecoles are quite unique. We can group the Ecoles into Public and Private Establishments. The Public Establishments, which number 104, can be subdivided into those that are tied to the "Secretariat d'Etat Aux Universités" (62 of them) and those that are tied to other Ministries (42); the Private Establishments, which number 41, can also be subdivided into those that receive support from the State and those that do not. Historically, Ecoles attached to a given Ministry were established to provide that Ministry with a pool of brain-power to draw upon. The "Ecole Supérieure des Mines," with campuses in Paris, St. Etienne, Douai and Alès, comes under the Ministry of Industry and Research and educates specialists in mining. The five "Ecoles Normales Supérieures," created by Napoleon, attached to the Ministry of Education, were originally supposed to train secondary school teachers; they reached such a high level of excellence, however, that they now train university professors, researchers and high level civil servants. The "Ecole Polytechnique," called for short "Polytechnique" or "X" (X, a symbol often used in mathematics, illustrates the heavy emphasis of theory found in the curriculum of this Ecole), is a prestigious institution attached to the Ministry of Defense, and trains "Ingénieurs de l'Armement." A student does his military service while attending the school; he wears a uniform and is under military rule. But, he need not become a professional soldier; he can serve as a civil servant in a number of government institutions. (President Giscard D'Estaing is a graduate of Polytechnique.) The "Ecole Supérieure de l'Electronique de l'Armée de Terre" and the "Ecole Nationale Supérieure de Techniques Avancées" are also attached to the Ministry of Defense.

The "Ecole Centrale des Arts et Manufactures," known for short as "Centrale" or "Piston" (slang), is attached to the "Sécrétariat d'Etat Aux Universités." It is an old (1829), prestigious school that rivals Polytechnique. The "Ecole Supérieure d'Eléctricite," known for short as "Sup. Elec.", is also attached to the "Sécrétariat d'Etat Aux Universités" but is a private Ecole. All these Ecoles award diplomas (Ingénieur Diplomé) with titles protected by the State. A graduate of an Ecole is not just a mechanical or an electrical engineer but is a mechanical engineer of the "Ecole Centrale" or an electrical engineer of the "Ecole Supérieure d'Electricité"!

Tuition fees of these Ecoles vary greatly. Many

of the Public Ecoles are practically tuition-free. In some, such as Polytechnique, a student is even paid a small stipend upon signing a contract promising to work for the government for the ten years following graduation. This contract can be waived if after graduation the "polytechnicien" specializes in another "Ecole de Spécialisation" or does research. If he decides to break his contract for, say, a job in industry, he must repay the government for his studies. At the present time this sum is roughly \$14,000, to be paid over a period of 6-10 years. Similar rules hold for the "Ecoles Normales Supérieures." Some of the private Ecoles, like "Sup-Elec," are heavily supported financially by several ministries so that their tuition is only about \$30/year. In other private Ecoles tuition can be as high as \$1000/year.

Graduates from the French university system do not have strong ties with their Alma Mater as most US graduates do. By contrast, the Grandes Ecoles, being very instrumental in forming the country's elite, provide the new graduate with a network of connections to alumni; these are in key positions in government and industry and tend to favor a candidate from their own Ecole. This is, no doubt, partly due to the fact that one is better aware of the program of studies of one's own Ecole and thus can better relate with the new applicant. People talk of the "Mafia de l'X'" to denote the strong bond that exists between new and old graduates of Polytechnique. In that respect, the Grandes Ecoles tend to foster a sense of belonging to an Alma Mater similar to the one found in the States. I was told that there is a move to resist this sort of inbreeding, for people have realized that a mix of graduates from different Ecoles tends to enhance the exchange of ideas. In all Ecoles, the alumni have considerable influence on the running of the school and on its curricula. They sit on governing boards and provide an excellent feedback tying the needs of industry to the curriculum taught in these Ecoles.

Thus, since their creation, the "Grandes Ecoles" have been relevant and have filled a need in society. This relevance, along with the highly motivated student body, has done much to stabilize the system against the winds of change which blew over France during the last ten years.

There are various kinds of Grandes Ecoles and they can be classified into eight categories: Commerce, Veterinary Sciences, Agriculture, Science and Engineering, The Arts,

#### R-11-76

Education, Military Science, Civil Service and Political Sciences. Law and Medicine are not found on this list; therefore, one trains for these professions via the university system. In this report I will focus on the Science and Engineering Ecoles.

#### II. Entrance Requirements

Again there are a number of subtleties involved, for not all these institutions have the same requirements. This is best explained if I refer the reader to Table I.

TABLE I

#### YEARS AFTER BACCALAUREAT

	1	2	3	4	5

Instituts Nationaux des Sciences Appliquées	✓	✓	/	<b>✓</b>	<b>✓</b>
Ecoles Nationales Supérieures d'Ingénieur	*	*	Δ	Δ	Δ
Other Grandes Ecoles	*	*	✓	✓	✓
Universities	Δ	Δ	Δ	Δ	~

- ✓ "classical" engineering preparation
- ▲ preparation tied to university
- preparatory forms that train students for the "concours"

We first find a group of schools entitled "Ecole Nationale d'Ingénieurs" followed by the town in which the Ecole is located. For example, "Ecole Nationale d'Ingénieurs de Brest" etc. These schools recruit directly after the "Baccalauréat" on the basis of a "concours," i.e., a competitive examination, and, unlike some other Ecoles, they do not require special preparation for this concours. Their curriculum runs for four years and forms "practical" engineers who have spent a year in industry as part of their training. While in

industry the position occupied by a student engineer is entrusted to the school to supervise.

We then find the "Instituts Nationaux des Sciences Appliquées." Again, that title is followed by the engineering specialty and the town in which the institute is located (for example, "Institut National Supérieure de Chimie Industrielle de Rouen"). These institutes are public entities attached to the "Sécrétariat d'Etat Aux Universités;" students are selected on the basis of their academic record possibly after an oral interview as well.

The "Grandes Ecoles," which include the larger and more prestigious ones, both public and private, rely upon concours or entrance examinations to select their candidates. The system is extremely selective for, in effect, there are two selections that take place. To prepare for these concours one enrolls in preparatory classes found in some of the larger lycées (high schools) which select only candidates who have obtained their Baccaleaureats with A's. This is the first selection. A student then spends two years drilling in mathematics, physics, and chemistry, with a sprinkling of literature and languages. At the end of this time and after an intense preparation, he takes the concours which consists of a written and oral part. Usually a student takes part in 3-5 of those examinations. He usually fails the first time around and only makes it after having had, in effect, three years of preparation. This constitutes the second selection. Out of 1600 candidates applying to Polytechnique only 300 are chosen. Out of 4200 candidates applying for Central and three other Ecoles having the same concours, only 710 are admitted. These numbers are quite typical of the highly selective process involved. Therefore, the Ecoles end up with the cream of the crop of the incoming students. In some cases several Ecoles join together and offer the same concours. If successful, a student can enter any one of these. His choice is dictated by the kind of informal hierarchy based on prestige, snob appeal, and scientific values, i.e., on considerations which are not always justified.

About two years ago the university system was for the first time entrusted with the education of engineers on some of its campuses. In this case the entrance requirements are those of the university system, i.e., a Baccalaureat. The program consists in the preparation of a Master's thesis at the university plus a year of practical engineering in industry. In 1972 a new type of university was created in Compiègne, some 80 km north of Paris. It is called

"Université Technologique de Compiègne" and modeled after US universities. It offers diplomas in engineering in a few fields.

Also some of the Ecoles are now working in conjunction with the universities and offer more advanced Doctoral Degrees. One must add that the events of 1968 discouraged some of the bright students from enrolling in the university system. Thus in the last 10 years the Ecoles have experienced an increased popularity.

#### III. The Teaching in the Science and Engineering Ecoles

The Ecoles that are training engineers and scientists can be divided into four categories:

- 1. The General Training or Military Ecoles, which number about 20, give a general engineering background covering aspects of chemical, civil, mechanical, electrical, control, and other types of engineering together with law, economics and management. Students do not specialize in any one branch of engineering but acquire the tools and the know-how to tackle a wide range of engineering problems.
- 2. The Specialized Training Ecoles, which are 6 in number, cover various types of engineering. Students select an option in which they specialize.
- 3. The Army Application Ecoles, which number 10, train highly qualified engineers who will serve the military; some of these Ecoles also train non-military professional engineers.
- 4. The Specialized Ecoles, which are more numerous since they number about 100, provide advanced training in specific disciplines such as electrical, mechanical, civil, chemical and aeronautical engineering, and physics, metallurgy, food sciences, agriculture, etc. Some of these schools offer a special program labeled "Corps de..." followed by the name of the Ecole (Example: Corps de l'Ecole des Mines, Corps des Ponts et Chaussées, Corps de l'Armement, etc...) in which the top students in the graduating class of Polytechnique (and now of some of the other top Ecoles) can enter to acquire a specialization. After graduation these students work for the State in the various Ministries.

# A. A General Training School: The Ecole des Mines de Nancy

This Ecole is affiliated with the "Sécrétariat d'Etat Aux Universités." Its curriculum provides scientific training which is primarily of a general nature, while the technological

#### R-11-76

education is provided by periods in industry, work in the laboratory or practical exercise sessions. An important part of the Ecole timetable is devoted to non-scientific disciplines: foreign languages, economics, sociology, law, organization, methodology, etc... These represent: 30% of the teaching time in the first year, 30% in the second year, 50% in the third year. The following tables give more details on the content of the courses.

#### TABLE II

1st year:

#### All courses must be taken by all students

Physics	Mathematics	Accounting	Two foreign
Mechanics	Programing	Economics	languages
Nuclear Physics	Numerical	Organization	German
Crystallography	Analysis	of work	English
Thermodynamics	Statistics	Oral & written	Russian
		communication	

7 weeks manual work in industry

2nd year:

#### Common courses

Methods of Organization enquiry and of work investigation Functional Analysis	Economics Operational Research	Two foreign languages German English Russian
---	--------------------------------------	--

7 weeks in industry

## Two of the following four options

I	II	III	IV
Solid State	Physical	Fluid	Probabilities Graph Theory Computer Science Mining or Geology
Physics	Metallurgy	Mechanics	
Metal Physics	Physico-	Heat	
Metal Chemistry	Chemistry	Transfer	

3rd year:

#### Common courses

Economics Marketing Financial Techniques	Decision Making Techniques Communication Techniques	Law Sociology	Two foreign languages: German English Russian
--	--	------------------	---

- 9 weeks in industry + 1 day per week
- + submission of a report

3 courses to be taken among the following

Mechanical properties of materials	Mathematical morphology
Electronic properties of materials	Methods of analysis and decision
Metallurgy	making
Control science	Mining engineering
Process control	Mines and geology
Aerothermics	Computer science
Turbomachines	Elasticity

# B. A special Training School: The Conservatoire National des Arts et Métiers

The "Conservatoire National des Arts et Métiers" (CNAM) is the oldest (1794) and largest (46,000 registrations) of the French establishment specializing in adult education. The main characteristic of the CNAM is that the teaching is provided essentially by evening lectures. It is a kind of adult university with its own department of engineering which gives courses in 16 general scientific subjects, 45 technical disciplines, and 27 economics subjects. Some of the courses may be followed in one of 34 provincial centers.

The engineer's diploma may be obtained after a parttime course of a duration up to seven years, depending on the initial training of the students, or on a fulltime basis in any of the 18 specialized institutes affiliated with the CNAM.

The curricula vary with the specialty chosen and include a certain amount of general non-scientific training, together with an in-depth study of a specific area. The last year is devoted to an industrial project, and the student must

submit a short thesis or a report describing his work.

# C. A Specialization School: The Ecole Supérieure d'Electricité (Sup. Elec.)

The first year is common to all students and contains lectures in mathematics (70 h.), computer science (20 h.), physics (125 h.), technology (100 h.), economics (20 h.) and 2 foreign languages.

In the second year the students follow a compulsory set of lectures in economics (20 h.), management (20 h.) and foreign languages and choose one of three following specializations: data processing and instrumentation; communications systems and components; and control.

The third year is entirely devoted to a further specialization in one of the following 13 options: control science, automation, industrial electronics, fast electronics, electronic structure of materials, electrical energy, computer science, metrology and instrumentation, radio-communications, computer systems, micro-electronics, process control, and advanced computer science.

#### IV. Engineering in France

I conclude this report with a glance at the situation of professional engineers in France. This paragraph is especially written for the reader who thrives on statistics. For those who do not, I apologize in advance.

The annual influx of engineers is about 8700 and has experienced no appreciable variation over the last few years. Table III displays both the number of alumni and the yearly flux of engineers in a given branch of science for the years 1971-74. Another graph (Fig. 1), which is of some value, shows the distribution of engineers in the various technologies and specialties. Most of the engineers are found in the private sector as can be seen from Fig. 2, while Fig. 3 displays the functions of engineers in terms of their age. As can be seen a small percentage works in research and that percentage decreases as the engineer gets older. Finally, Fig. 4 gives an idea of the salary expressed in dollars (\$1 = 4FF) for the year 1974.

#### V. Conclusions

France possesses a unique higher education system

for the training of its engineers. The system is old, having been in existence for nearly two centuries. It has survived the 1968 student crisis with very minor modifications; now, students sit on some of the committees of the Grandes Ecoles. This fact ought to be an eloquent testimony for the adequacy of this system of education. These Ecoles carry out the French philosophy of "oriented research", which is not to be interpreted as applied industrial research but rather as research oriented towards a specific goal (what we might label "Applied Mathematics" in the US). I would venture to say that this system tends to form, on the whole, somewhat better engineers than the ones formed in the US although, sometimes, their lack of "practical engineering" might prove to be a drawback. Most of the Ecoles' very selective enrollment guarantees them the cream of the crop of incoming students who have acquired rigorous foundations in sciences and mathematics, a habit for work and high motivation. Some cynics claim that once accepted in a Grande Ecole, the student's toil is over and all he has to do is get out of it, and that this entails a minimum of effort.

Research in these Ecoles is supported to a high degree by industrial contracts. These contracts are also a means of keeping the teaching and research found in these institutions relevant. The graduates of these Ecoles permeate not only French industry but also the civil service and the military. These engineers have done much to provide France with the well-known French engineering know-how. The system tends to perpetuate itself via the strong ties that develop between a given Ecole and its alumni who take an active part in the running of their Ecole.
